

# Our idiots' guide to **BUILDING** *your* **MILK BOX**

Ready to beat the heat and protect your produce from warm mornings and hungry critters?

Our double insulated milk box is a cardboard box (without the big or little fish), and it's even easier to construct than Swedish flat-pack furniture. Just pop in a frozen water bottle or ice pack to help beat the heat!

Follow our guide to build your milk hut in just a few simple steps!

## Finding inner (and outer) piece:

Outer piece  
(with wording/print on)

Inner piece

### Please note:

Our Milk Box is made from 100% cardboard, so once it becomes an ex-box, it can go straight in your home compost or recycling!

INSTRUCTIONS**

# How to BUILD THE BOX

## Building the outer box:

1. Place the outer layer flat on the floor, ensuring the QR code is facing upwards.

2. The QR code should be on the bottom (closest to you), so it's upside down. This is your lid.

3. Fold the flaps around the QR code panel inwards, allowing the longer side pieces to curl inwards at the bottom to make your lid.

4. Bring up the sides to start building the main part of the box, making sure the small flaps are on the inside of the box.

5. Fold over the longer flaps to secure the structure.

## Inserting the inner lining:

1. Place the inner liner on its side.

2. Slot it into the box.

## Told you it was easy!

Now all that's left to do is add a frozen ice pack or metal water bottle to your box to keep it cool, before leaving it on your doorstep, ready for your VIP (Very Important Produce).
